

TECHNICAL MEMORANDUM

TO: Jory Phillips, City of Santa Monica
FROM: Sean Mohn and Eugene Tang, AICP
DATE: December 30, 2012
RE: Summary of Findings
Santa Monica Parking Demand Analysis

Ref: J1189

The City of Santa Monica is in the process of preparing an update to the parking requirements of the *Santa Monica Municipal Code* (Municipal Code). As part of this process, the City is currently reviewing previously recommended parking strategies designed to help the City achieve the land use and development goals as defined by the recently adopted Land Use and Circulation Element (LUCE) of the Santa Monica General Plan.

Gibson Transportation Consulting, Inc. (GTC) was asked to provide a detailed parking demand analysis (the Project). Throughout the process, GTC worked with the project team, City staff, and community stakeholders in order to ensure that the City's goals were being met. This technical memorandum summarizes the Project process and conclusions. Attachments A and B to this memorandum provide the shared parking tables and charts and the parking occupancy survey worksheets, respectively.

STUDY APPROACH

The commercial districts selected for this analysis were identified based on information gathered at meetings with City staff and a review of parking utilization data from a previous data collection effort. Based on this effort, the final study area was defined to focus on various commercial districts located outside of the Downtown commercial district.

A total of five commercial districts along active corridors were identified through this process and include: Main Street, Montana Avenue, Ocean Park Boulevard, Santa Monica Boulevard, and Wilshire Boulevard. Figure 1 illustrates their relative locations within the City.

A comprehensive field data collection program was developed for each of the five commercial districts. The program was comprised of a review of previously collected parking utilization data for peak demand periods, an on-street/off-street parking inventory collected along the corridor, an on-street parking inventory collected along selected side-streets of the corridor, and a weekday/weekend parking utilization survey. The parking occupancy survey worksheets are available in Attachment B. Figures 2-6 summarize the parking occupancy surveys for the analyzed corridors.

In addition to the field data, City staff provided general land use data for each of the five commercial districts. This data included the street addresses of all commercially zoned properties along the corridor, the total floor area of each commercial building, the zoned land use, and floor areas associated with the zoned land use. The land use data was utilized two ways: to estimate the parking requirements for each commercial district based on the Municipal Code, and to develop shared parking models for each commercial district.

Municipal Code Requirements

The Municipal Code establishes a series of design and development standards to be adhered to by all projects. Specifically, Section 9.04.10.08.040 of the Municipal Code identifies the specific standards to be applied relative to the provision of parking; in this section, the City requires a specific rate of parking spaces to be provided based on the type of land use.

The parking rate is keyed to a size metric of the land use. In this case, parking requirements for the commercial uses within each commercial district are based on the amount of floor area (square feet [sf]) available. The required parking rates were applied to the commercial uses through the land use data provided by the City. Parking requirements at the existing rates were calculated without assuming any previous zoning variances. The Municipal Code is, in essence, a cumulative calculation of parking required for all land uses of a given area/development.

Shared Parking Methodology

Shared Parking, 2nd Edition (Urban Land Institute [ULI] and the International Council of Shopping Centers, 2005) details a model that was developed/updated for the purposes of measuring the peak parking demand for every land use within a given area/development.

Similar to the Municipal Code, parking demand rates in the shared parking model are identified by land use and calculated based on a size metric. The shared parking methodology, however, recognizes that parking spaces can be used to serve two or more individual land uses without conflict or encroachment. The shared parking concept has long been observed in central business districts, suburban commercial districts, and other areas where land uses are combined. Downtown Santa Monica has used this model successfully for some time. Shared parking is the result of two conditions:

1. Variations of the peak accumulation of parked vehicles occur because of time differences in activity patterns of adjacent or nearby land uses (by hour, by day, and by season).
2. There are clearly relationships among the land use activities that result in people being attracted to two or more land uses on a single automobile trip to a given area/development.

The following describes the calibration of the shared parking models for use in this analysis. *Shared Parking, 2nd Edition* defined base data (national averages) to be used for parking demand rates for various land uses and it suggested ranges of assumptions to be used for hourly and seasonal variations. The methodology, however, stated that the best way to measure

the demand at a particular area/project is to use local data to modify the base data so that they reflect the local conditions.

In the interest of maintaining a level comparison to the Municipal Code requirements, the shared parking model did not include adjustments for mode choice or internal capture. That is, the parking demand was developed without taking into account any potential reductions related to non-automotive travel (mode choice) or the expected interaction among the adjacent land uses (internal capture). However, adjustments that reflect the unique usage patterns over the course of a day (hourly accumulation) for a given land use were applied to account for the hourly parking accumulation observed during the survey. Shared parking, in other words, does not assume that peak parking demands would occur simultaneously for the individual land uses in any given area/development. The models were calibrated to the surveyed conditions in August; the standard seasonal rates identified by ULI were maintained. In maintaining the level comparison against the Municipal Code requirements, the projected peak parking demand was identified in each model; this is the highest anticipated parking demand, which compares favorably to the Municipal Code requirement. As a result of the commercial nature of each corridor, the shared parking models indicate that the projected peak parking demand occurs in December. The shared parking tables and charts for each commercial district are available in Attachment A.

Comparisons for each commercial district were prepared highlighting the parking survey data, calculated Municipal Code requirements, and peak parking demand from the shared parking model. The details of each commercial district parking analysis are discussed below.

The survey data represents the peak observed demand during the analysis periods, and this data is reflective of all the unique characteristics in each corridor. Essentially, the data reflects the local conditions. Though not easily quantifiable for this analysis, the local conditions include multiple factors such as the use of bike/transit/walk modes, the richness of transit service, the density of the commercial corridor, the likelihood of interaction among land uses, and the implementation of local land use and transportation policies. Further, it should be noted that while several off-street parking lots were included in the study, they were not necessarily available to the general public, particularly under current regulations.

Figures 7 through 11 illustrate these comparisons. The notable trend is that the Municipal Code requirement is higher than the ULI peak parking demand. Comparatively, both the survey data and off-street parking supply are lower than both the Municipal Code requirement and ULI peak parking demand¹ for most of the analyzed corridors.

MAIN STREET COMMERCIAL DISTRICT

The section of the Main Street corridor selected for analysis lies between Pico Boulevard and Marine Street.

¹ As noted in the following sections, the ULI peak parking demand is estimated to occur in December; this is based on the base ULI monthly variations in the model. Although Figures 7-11 depict the peak August demands, the actual peak parking demands in December may be higher than observed in August but are likely less than the projected peaks of the ULI model.

Corridor Description

The key characteristics of the Main Street corridor include a relatively lower density mixed-use (residential/retail/services) section between Pico Boulevard and Ocean Park Boulevard and a higher density mixed-use (restaurant/retail) section found between Ocean Park Boulevard and Marine Street. This corridor is in close proximity to the attractions typically found along the coast of Santa Monica and likely subject to a higher percentage of out of area visitors (tourists), relative to the other study corridors; the high density commercial section of the corridor is home to a robust nightlife scene.

Data Collection

Survey times were selected to avoid undue influence from visitor demand while capturing typical parking demand patterns. Based on the characteristics of the corridor, the 6:00 PM to 12:00 AM period was identified for survey. Surveys were then completed on Friday, August 24, 2012 and Saturday, August 25, 2012.

Parking inventory was collected along the Main Street corridor, in off-street lots accessed from the corridor, and one block in each direction on side streets. The observed parking supply is approximately 1,752 spaces. The inventory is comprised of 206 on-street spaces along Main Street, 1,278 off-street spaces in private and public parking lots, and 268 on-street spaces along side streets.

Parking Analysis Summary

Parking occupancy survey results for Friday and Saturday are summarized in Figures 2A and 2B, respectively. During Friday evening, the overall parking demand generally appears consistent between 6:00 PM and 9:00 PM with demand above 1,000 spaces. The peak parking demand was observed between 6:00 PM and 7:00 PM, where total demand was approximately 1,128 spaces or 64% of the available supply.

On Saturday, the overall demand pattern was similar to the observed Friday pattern; that is, overall parking demand between 6:00 PM and 9:00 PM was consistently greater than 1,000 spaces. The peak observed demand also occurred between 6:00 PM and 7:00 PM with a total demand of 1,064 spaces or 61% of the available supply.

The land use data indicates that the total commercial floor area available in the corridor is approximately 630,431 sf. Of this, there is approximately 369,839 sf of restaurants/retail establishments (approximately 59%), approximately 178,998 sf of office uses (approximately 29%), and 78,730 sf of other uses (approximately 12%). This data was used to estimate the Municipal Code parking requirement and calibrate the shared parking model.

The estimated Municipal Code parking requirements indicate that the analyzed Main Street corridor would require a total of 3,432 spaces. The shared parking model of the corridor projected a peak demand of 2,696 spaces, which would occur at 1:00 PM on a December weekday.

MONTANA AVENUE COMMERCIAL DISTRICT

The section of the Montana Avenue corridor selected for analysis lies between Lincoln Boulevard and 17th Street.

Corridor Description

The key characteristic of the Montana Avenue corridor is the medium density mixed-use commercial district bordered by single family homes to the north and a mixture of single family/multi-family residential units to the south. The commercial uses in the corridor trend toward boutique retail, personal services, or bars/restaurants.

Data Collection

Survey times were selected to capture the weekday daytime commercial activity along with the weekday/weekend evening activity. Based on the characteristics of the corridor, the weekday 11:00 AM to 1:00 PM & 5:00 PM to 8:00 PM and weekend 6:00 PM to 9:00 PM periods were identified for survey. Surveys were then completed on Friday, August 24, 2012 and Saturday, August 25, 2012.

Parking inventory was collected along the Montana Avenue corridor, in off-street lots accessed from the corridor, and one block in each direction on side streets. The observed parking supply is approximately 1,833 spaces. The inventory is comprised of 176 on-street spaces along Main Street, 772 off-street spaces in private and public parking lots, and 885 on-street spaces along side streets.

Parking Analysis Summary

Parking occupancy survey results for Friday and Saturday are summarized in Figures 3A and 3B, respectively. During Friday mid-day, the overall parking demand occurs between 1:00 PM and 2:00 PM with a demand of 1,214 spaces or 66% of the supply. In the evening, the peak parking demand was observed between 5:00 PM and 6:00 PM, where total demand was approximately 975 spaces or 53% of the available supply.

On Saturday, the peak observed demand also occurred between 6:00 PM and 7:00 PM with a total demand of 915 spaces or 53% of the available supply.

The land use data indicates that the total commercial floor area available in the corridor is approximately 380,869 sf. Of this, there is approximately 269,162 sf of restaurants/retail establishments (approximately 71%), approximately 79,126 sf of office uses (approximately 21%), and 32,581 sf of other uses (approximately 8%). This data was used to estimate the Municipal Code parking requirement and calibrate the shared parking model.

The estimated Municipal Code parking requirements indicate that the analyzed Montana Avenue corridor would require a total of 1,847 spaces. The shared parking model of the corridor

projected a peak demand of 1,559 spaces, which would occur at 1:00 PM on a December weekday.

OCEAN PARK BOULEVARD COMMERCIAL DISTRICT

The section of the Ocean Park Boulevard corridor selected for analysis lies between 16th Street and 20th Street.

Corridor Description

The key characteristic of this two-block stretch of Ocean Park Boulevard is a lower density (somewhat suburban in character) mixed-use commercial district bordered by single family homes to the north and the south. The commercial uses in the corridor trend toward neighborhood-type retail, personal services, and bars/restaurants.

Data Collection

Survey times were selected to capture the neighborhood serving activity during the weekday evening and weekend mid-day periods. Based on the characteristics of the corridor, the weekday 6:00 PM to 9:00 PM and weekend 11:00 AM to 1:00 PM periods were identified for survey. Surveys were then completed on Friday, August 17, 2012 and Saturday, August 18, 2012.

Parking inventory was collected along the Ocean Park Boulevard corridor, in off-street lots accessed from the corridor, and approximately one-half block² in each direction along the side streets. The observed parking supply is approximately 413 spaces. The inventory is comprised of 67 on-street spaces along Ocean Park Boulevard, 310 off-street spaces in private and public parking lots, and 36 on-street spaces along side streets.

Parking Analysis Summary

Parking occupancy survey results for Friday and Saturday are summarized in Figures 4A and 4B, respectively. During Friday evening, the peak demand occurs at 6:00 PM to 7:00 PM with a demand of approximately 238 spaces, nearly 58% of the available parking. On Saturday, the peak occurred between 11:00 AM and 1:00 PM with a demand of 231 spaces or 56% of the supply. It should be noted that the demand patterns on both surveyed days were generally consistent; stable demand was observed through the surveyed periods.

The land use data indicates that the total commercial floor area available in the corridor is approximately 68,134 sf. Of this, there is approximately 40,294 sf of restaurant/retail/service

² Metered parking was available on side-streets up to the alley from the corridor; the remainder of side street parking consisted of residential permit parking.

establishment (approximately 59%) and approximately 27,840 sf of office-type uses (approximately 41%). This data was used to estimate the Municipal Code parking requirement and calibrate the shared parking model.

The estimated Municipal Code parking requirements indicate that the land uses along the Ocean Park Boulevard corridor would require a total of 300 spaces. The shared parking model of the corridor projected a peak demand of 259 spaces, which would occur at 2:00 PM on a December weekday.

SANTA MONICA BOULEVARD COMMERCIAL DISTRICT

The section of the Santa Monica Boulevard corridor selected for analysis lies between Chelsea Avenue and Stanford Street.

Corridor Description

This four-block stretch of the Santa Monica Boulevard corridor is characterized by a mid-density mixed-use commercial district. This section of the corridor is bordered by multi-family residential units to the north and the south. The commercial uses in the corridor trend toward neighborhood-serving retail/services mixed with auto-oriented businesses, fast food outlets, and a national chain drug store.

Data Collection

Survey times were selected to capture the neighborhood serving activity during the weekday mid-day/evening and weekend mid-day periods. Based on the characteristics of the corridor, the weekday 11:00 AM to 1:00 PM & 6:00 PM to 9:00 PM and weekend 10:00 AM to 1:00 PM periods were identified for survey. Surveys were then completed on Friday, August 24, 2012 and Saturday, August 25, 2012.

Parking inventory was collected along the Santa Monica Boulevard corridor, in off-street lots accessed from the corridor, and approximately one-half block³ in each direction along the side streets. The observed parking supply is approximately 983 spaces. The inventory is comprised of 85 on-street spaces along Santa Monica Boulevard, 805 off-street spaces in private and public parking lots, and 93 on-street spaces along side streets.

Parking Analysis Summary

Parking occupancy survey results for Friday and Saturday are summarized in Figures 5A and 5B, respectively. During the Friday mid-day, the peak demand occurred at 12:00 PM with a demand of approximately 577 spaces, nearly 59% of the available parking; during Friday

³ Metered parking was available on side-streets up to the alley from the corridor; the remainder of side street parking consisted of residential permit parking.

evening, peak demand occurred at 6:00 PM with a demand of 518 spaces or 53% of the supply. On Saturday, the peak occurred at 1:00 PM with a demand of 464 spaces or 47% occupancy.

The land use data indicates that the total commercial floor area available in the corridor is approximately 330,580 sf. Of this, there is approximately 171,765 sf of restaurant/retail/service establishments (approximately 52%), approximately 120,624 sf of office-type uses (approximately 36%), and a 38,191 sf hotel (approximately 12%). This data was then used to estimate the Municipal Code parking requirement and calibrate the shared parking model.

The estimated Municipal Code parking requirements indicate that the land uses along the Santa Monica Boulevard corridor would require a total of 1,700 spaces. The shared parking model of the corridor projected a peak demand of 1,542 spaces, which would occur at 1:00 PM on a December weekday.

WILSHIRE BOULEVARD

The section of the Wilshire Boulevard corridor selected for analysis lies between Lincoln Boulevard and 17th Street.

Corridor Description

This nine block stretch of the Wilshire Boulevard corridor is characterized by a high density mixed-use commercial district with service by multiple transit lines. This section of the corridor is also bordered by multi-family residential units to the north and the south. The commercial uses in the corridor trend toward neighborhood-serving retail with bars and restaurants and medical services mixed with a supermarket/drugstore center.

Data Collection

Survey times were selected to capture the neighborhood serving activity during the weekday and weekend mid-day/evening periods. Based on the characteristics of the corridor, the 11:00 AM to 1:00 PM & 5:00 PM to 8:00 PM periods were selected for survey on a weekday and weekend. Surveys were completed on Friday, August 17, 2012 and Saturday, August 18, 2012.

Parking inventory was collected along the Wilshire Boulevard corridor, in off-street lots accessed from the corridor, and one block in each direction along the side streets. The observed parking supply is approximately 2,326 spaces. The inventory is comprised of 159 on-street spaces along Wilshire Boulevard, 1,546 off-street spaces in private and public parking lots, and 621 on-street spaces along side streets.

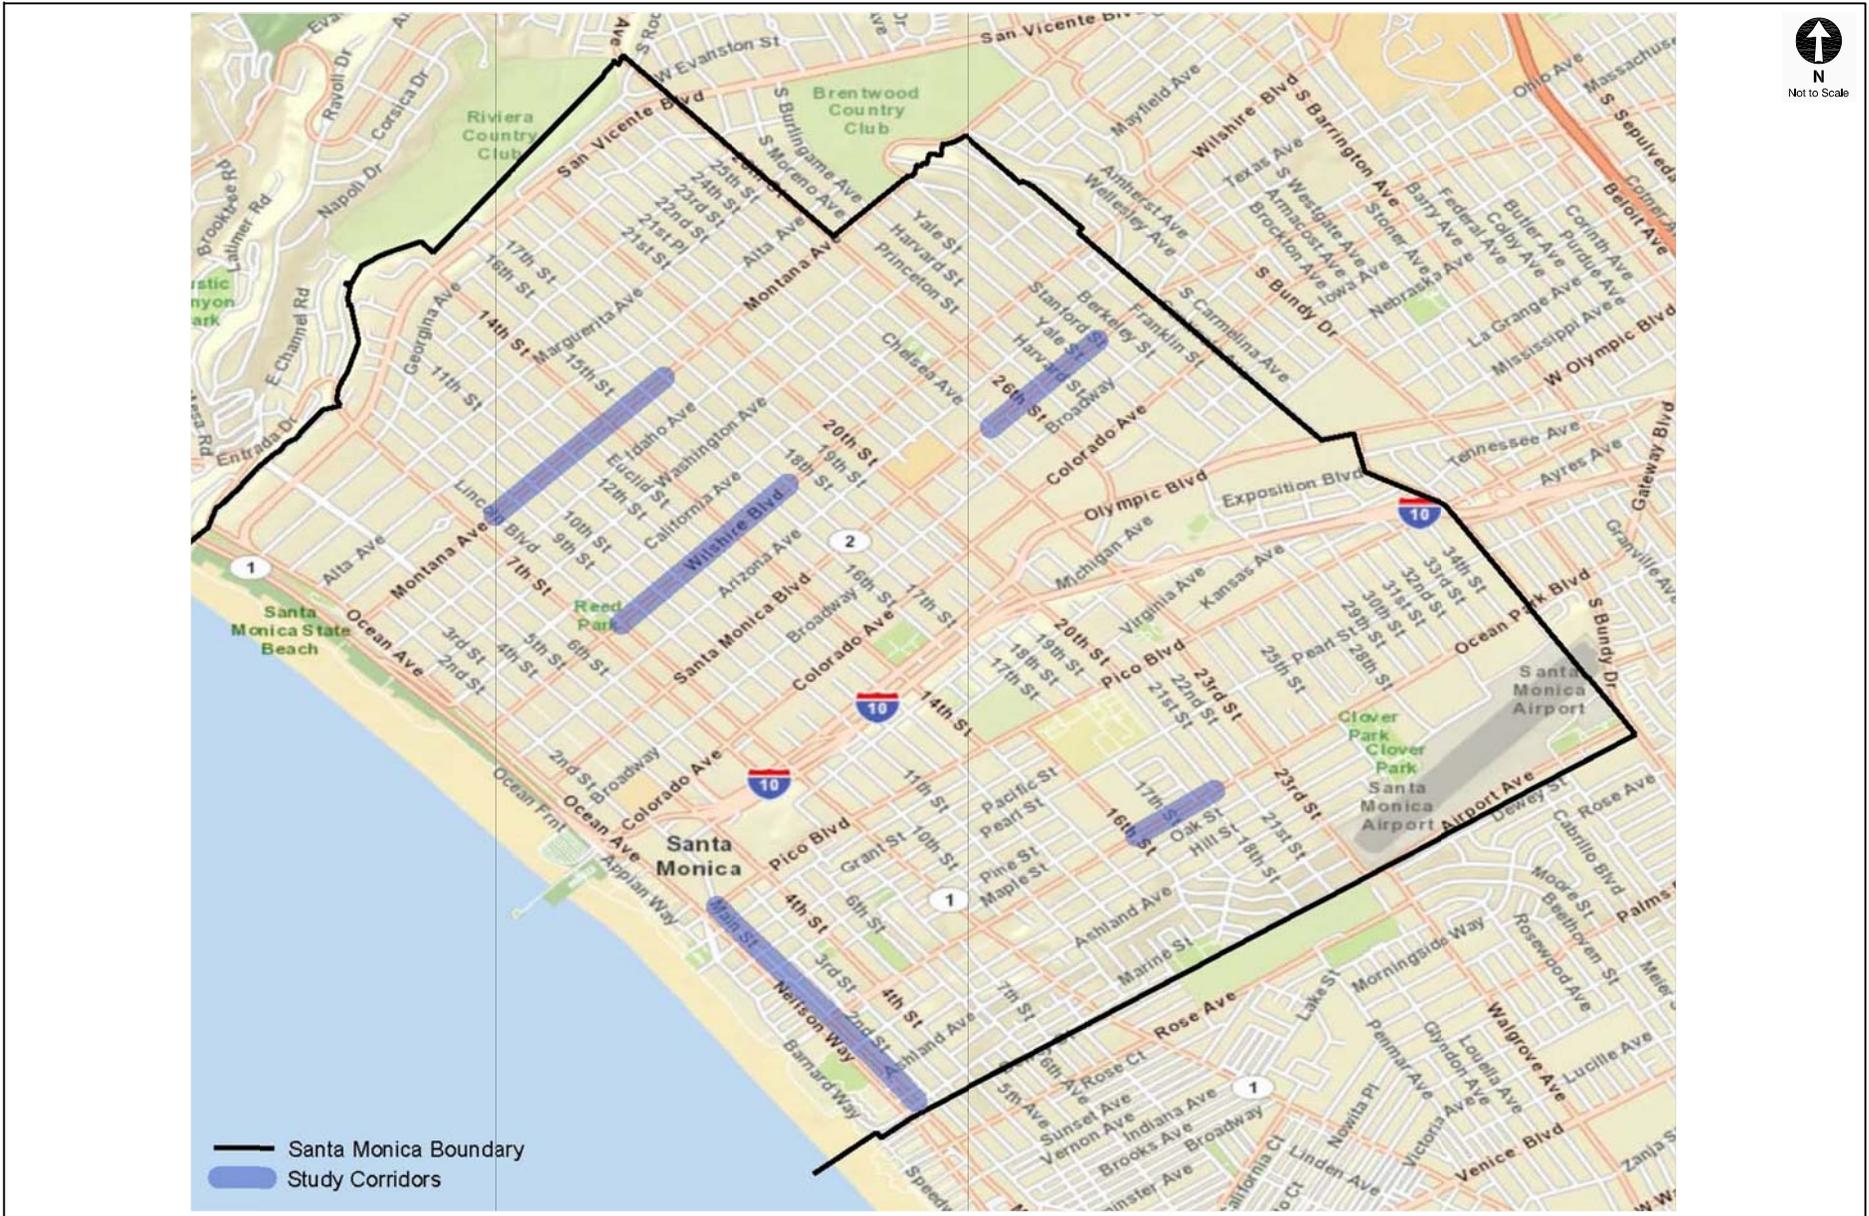

Parking Analysis Summary

Parking occupancy survey results for Friday and Saturday are summarized in Figures 6A and 6B, respectively. During the Friday mid-day, the peak demand occurred at 12:00 PM with a demand of approximately 1,252 spaces, nearly 54% of the available parking; during Friday

evening, peak demand occurred at 6:00 PM with a demand of 909 spaces or approximately 39% of the supply. During the Saturday mid-day, the peak occurred at 12:00 PM with a demand of 1,098 spaces or 47% of the supply; for the Saturday evening, the peak demand occurred at 6:00 PM with a demand of 816 spaces or 35% occupancy. Each of the four analyzed periods exhibited a fairly stable demand pattern over the course of the survey; that is, the overall demand values were close with minor variation between the low and peak demands.

The land use data indicates that the total commercial floor area available in the corridor is approximately 514,609 sf. Of this, there is approximately 306,058 sf of restaurant/retail/service establishments (approximately 59%), another 166,518 sf are designated office-type uses (approximately 32%), with approximately 42,033 sf of other uses (approximately 8%). This data was then used to estimate the Municipal Code parking requirement and calibrate the shared parking model.

The estimated Municipal Code parking requirements indicate that the land uses along the Santa Monica Boulevard corridor would require a total of 2,638 spaces. The shared parking model of the corridor projected a peak demand of 2,104 spaces, which would occur at 2:00 PM on a December weekday.
